

# **Supplementary Material for ‘Food web structure and species’ role in an oceanic Marine Protected Area in the subantarctic’**

## **Methodology**

### **Food web construction**

The following figure and tables summarise the data we used to build the network of trophic (predator-prey) interactions for the Marine Protected Area Yaganes ecosystem. Details of some results are also included. Table 1 is the complete list of trophic interactions and references that confirm each of them. Table 2 is the species list with details on trophic species cases (aggregated taxa) and its species-level properties (in-degree, out-degree, total degree, closeness, betweenness, trophic level and keystone species index). Table 3 shows the results of the degree distribution fit of the food web.

Table 1: List of predator-prey (trophic) interactions used to build the network for the Marine Protected Area Yaganes ecosystem (MPAY).

Table 3: Results of the degree distribution fit. Exponential and power law model families were tested, and AIC (Akaike Information Criterion) and BIC (Bayesian Information Criterion) were used to select the best fit (i.e., lower AIC and BIC). The exponential model is the best fit.

AIC	BIC	Model family	Model
-159	-153.8	Exponential	Exp
-41.82	-36.83	PowerLaw	Power
-31.17	-26.18	Exponential	LogExp
80.55	85.54	PowerLaw	LogPower
